Mozilla firefox download for android phone. Mozilla firefox download for android tablet. Android mozilla firefox. Mozilla android download.

After the wildly successful launch of Firefox 4 not that long ago, it's hard to believe the next iteration of Mozilla's popular and free open source browser is already here. Sure enough, though, Firefox 5 was officially released on Tuesday complete with a raft of new features that promise to give the browser yet another boost. I've been playing around with Firefox 5 for some time already, and though it's not as big an upgrade as Firefox 4 was, it's been rock solid—and fast. I wrote just last week about a number of the key new features appearing in the release candidate. Now that the final version is here, however, there's no more reason to delay. Here are five good reasons you should download Firefox 5 as soon as you can.

1. It Respects Your Privacy Mozilla's Do Not Track feature gives users more control over the way their browsing behavior is tracked and used on the Web by allowing them to tell the websites they visit that they want to opt out of online behavioral tracking. Now, in Firefox 5, Do Not Track is even easier to find in the Firefox Preferences section. Also of note is that Firefox 5 for Android includes the Do Not Track feature as well, making Firefox the first browser to support Do Not Track on multiple platforms, Mozilla says.
2. It's Small and Fast I've been feeling like Firefox 5 is faster, and that impression was recently confirmed over at Digitizer, which ran it through a bunch of benchmarks. Firefox actually blew away both Chrome and Opera on the SunSpider JavaScript test, in particular (no other browsers were included), and its cold start time compared very well with that of Google's Chrome. Firefox 5 was also notable for taking up minimal RAM, even with 25 websites opened.
3. It Supports an Open Web With improved standards support for HTML5, XHR, MathML, SMIL and canvas, Firefox 5 is the best browser choice for an open Web. The new Firefox Add-on SDK for Windows, Mac and Linux enables local development of add-ons, meanwhile, and the Firefox Add-on Builder Beta provides a hosted Web-based build environment. The new version of the multipatform software also adds support for CSS animations.
4. It Sports 1000 Improvements It's actually more than 1000 improvements and performance enhancements that have been included in Firefox 5. They may not all be huge, noticeable user-interface changes, but they definitely make the software better. The Android version of Firefox 5, meanwhile, includes a raft of bug fixes, improved page load speeds—especially on 3G networks—and added IPv6 support.
5. It's Secure, Independent and User-Driven Firefox is open source software, which means it's not only developed with the help of users, but its security is continuously monitored and improved by a global community of users and developers. Mozilla, meanwhile, is an independent foundation. There's no way a proprietary browser maker like Microsoft—or even a company like Google, which has its fingers everywhere—can compete with that independence and user focus. Firefox clearly faces stiff competition from Google's Chrome, but further improvements are on the way in Firefox 6 and beyond. You can download it here and see for yourself. No new notifications You'll get updated when important things are happening, and when you engage with our community. Mozilla Firefox (opens in new tab) was originally created to be a faster, safer alternative to popular late-90s browsers (opens in new tab), like Internet Explorer. Today, Firefox is still revered for its performance and privacy. Interested in Firefox? Check out the website here (opens in new tab) When it comes to safety, the benefit is obvious, and with Firefox, very little data is collected about you. Plus, even if a hacker makes their way into your browser, Firefox has built-in protection to still keep you safe. Mozilla continually adds new features to Firefox (Image credit: Mozilla) Features Firefox shines when it comes to its security features, but in terms of its regular features, there's not much that's beyond the pale. While you won't choose Mozilla based on these, they're certainly nice (and necessary) to have in a browser, and there are one or two extras you probably won't find elsewhere. With Firefox, you can search in the address bar, get smart search suggestions, and get bookmarks, history, or open tabs in your search results. There's also auto-suggest for URLs, and you can tweak your search bar settings to have more control over your browsing experience. Other features include blocking auto-play of audio and video and viewing picture-in-picture pop-out videos (opens in new tab) separate from your browser window to stream something while multitasking. There's also a built-in screenshot tool, dark mode and custom themes, extensions, form autofill, pinned tabs, reader mode, and spell check. Lastly, Firefox is available in 90+ languages, is compatible with Google products (like Docs and Gmail), and will sync across all of your devices. Mozilla's commitment to privacy is unmatched in the industry (Image credit: Mozilla) Privacy According to their website, the browser "collects so little data about you, we don't even require your email address to download." That's true ... kind of. Once you download Firefox, they do ask for your email to fill out your Account Settings though this isn't necessary to use Mozilla's browser. Hopefully, these other security features will impress you even after you've handed over a space in your inbox. Private browsing mode: Automatically erases your online info (cookies, history, passwords) from your computer when you close the browser. Tracking protection: Blocks ads and websites that try to attach hidden trackers to you to collect your browsing info. Ad blockers: Not only will trackers not know what you're doing online, but ads won't slow down the loading of web pages, either. Cryptominer blocking: If a cryptominer (opens in new tab) has gained access to your browser, you may notice that your battery is running down a lot faster than before or your computer feels hot. Firefox helps stop this before it wreaks more havoc. DNS over HTTPS (DoH (opens in new tab)): Stops internet service providers from selling your data. Primary password: This is how you access your password keeper. You'll set different primary passwords for different devices. Firefox also has automatic updates, breached website alerts, a built-in password manager (opens in new tab), encrypted data, fingerprint blocking (opens in new tab), individual protection reports and third-party cookie blocking (opens in new tab). User experience Firefox is very minimalist, with a fresh white background and easy-to-read, larger-than-normal black text for much of the default font. When you open a new tab, you'll see your shortcuts and a list of top articles from Pocket. Clicking the Settings gear on the top-right of the page lets you customize this page, too. You can add more rows of shortcuts, opt-in or out of seeing sponsored content and Recommended by Pocket stories, and toggle on or off your recent activity and snippets (which are tips and news from Mozilla/Firefox). The rest of the browser settings are easy to go through, too. There are enough that you can play with how the browser behaves and looks, but not so much that you feel like you'll miss something because you don't want to read through them all. Google is the default search engine, which is nice, but you can switch to Amazon, Bing, eBay or Wikipedia (and others you may have installed, like DuckDuckGo (opens in new tab)). Search results are also delivered in a clean and minimal way (Image credit: Google) There's nothing particularly special about how search results are displayed, but like we said before, you go with Mozilla for a lean and safe experience, not a feature-packed one. Some may find this perfectly zen-like. You can use Firefox on your desktop and mobile devices (Image credit: Mozilla) Platforms Firefox is compatible with Mac, Linux and Windows machines, and there are also mobile browsers for Android and iOS. You can sync Firefox—your bookmarks, history and tabs—on all of your devices, so long as you have a Firefox account. More details about system requirements are available here (opens in new tab). Mozilla has a comparison tool on its site that allows you to compare Firefox to other popular browsers (Image credit: Mozilla) The competition It's hard to find some features that Firefox has all in one browser, like text-to-speech, reading mode and the ability to block cryptominers. Let's go over the main comparisons between Firefox and other leading browsers. When compared to Safari (opens in new tab), Firefox's standout features are its in-browser screenshot tool and the primary password requirement. When compared to Google Chrome (opens in new tab), Firefox blocks third-party tracking cookies and social trackers. Chrome doesn't have a primary password option, either.) And according to Mozilla, Firefox uses less RAM than Chrome. When compared to Microsoft Edge (opens in new tab), Firefox's main competitive feature is blocking auto-play. Final verdict While some people have a love-hate relationship with Firefox (or a hate-hate one, even), we can't help but find it endearing. It's the simplest browser around while still being attractive—the bold black font that's a little larger than the norm makes it modernly minimalist, not boring or plain. You feel like you've got a lot of protection on your side when you're using it since it goes overboard (thankfully) with privacy and security features. And it does just what a browser should do: Find what you're searching for and react quickly when you interact with it. We've also featured the best browser (opens in new tab) The popular Firefox browser from Mozilla has just past its billionth download. The company expected the milestone to be reached sometime today. As forecast, Firefox reached its landmark download at 15:00 UTC, at which point the browser was being downloaded at a rate of 24 times per second. Those tracking the impending achievement could do so via an official Mozilla site or over on a Twitter account specifically set up to keep tabs on how many times the open source browser has been downloaded. However, it's worth noting that this benchmark doesn't signify that Firefox has a billion active users, just how many times it has been downloaded since its 2004 launch. Firefox is now at version 3.5 and is one of the fastest browsers available, second only to Google's Chrome, and despite 3.5's recent release the Mozilla foundation are already looking forward on how to improve the next version. Mozilla is set to launch One Billion Plus You on Monday, with more details and comprehensive statistics on the accomplishment. Be sure to share your thoughts and experiences with the Firefox browser in the comments.
